

Easier, faster and safer management of Xi R2 Security

Managing security is not easy in Xi R2. The CMC offers less flexibility and especially visibility on your security configuration. **360view Release 2** is a replacement for the CMC of BusinessObjects Xi R2. Some of the key features are:

- User-friendly web-based interface replacing the CMC;
- Dynamic security setup using a matrices interface (see screenshot);
- Dynamic visibility on rights for folders and applications with respect to groups;
- Define your own security profiles for pre-defined access levels. With larger environments, this saves hours if not days. All objects are covered;
- Manage content using a hierarchical perspective for easier visibility and time savings;
- Export to Microsoft Excel using automatic generation of rights matrices, object trees, group-user trees and universe overloads. This allows you to document your security setup. You can even share these with end user group managers for validation;
- Document & Audit your deployed security - from profiles all the way down to the resulting affected rights of EVERY user. Includes audit reports;
- User as well as object centric view of security.

How does 360view change the way I manage my security?

360view Release 2 is a revolution in how you manage security in BusinessObjects Xi. The CMC allows you to change one object at a time, and gives you no visibility on the hierarchies of groups assigned to that object. This works if you keep track of it and keep it simple but if you don't (or can't), it can get complex fast.

360view Release 2 adds hierarchical views on security assignments and allows you to dynamically define what happens at every intersection of folders and groups. And all this is exportable to Excel for documentation. This dynamic matrix management applied to security is simply a breakthrough (patent pending).

The CMC no longer gives the ability to define custom profiles, so if you do not select default security options, you have to configure all the security accesses by hand for every group, resulting in a long and painful process of clicks and steps. 360view brings back the profiles,

allowing you to define this access once and apply it where required. If you missed the **old Supervisor**, we brought back its most useful features.

360view puts you in full and painless control of your security and saves you time, letting you focus on more value added activities. This is more significant the larger the number of users you have in your environment.

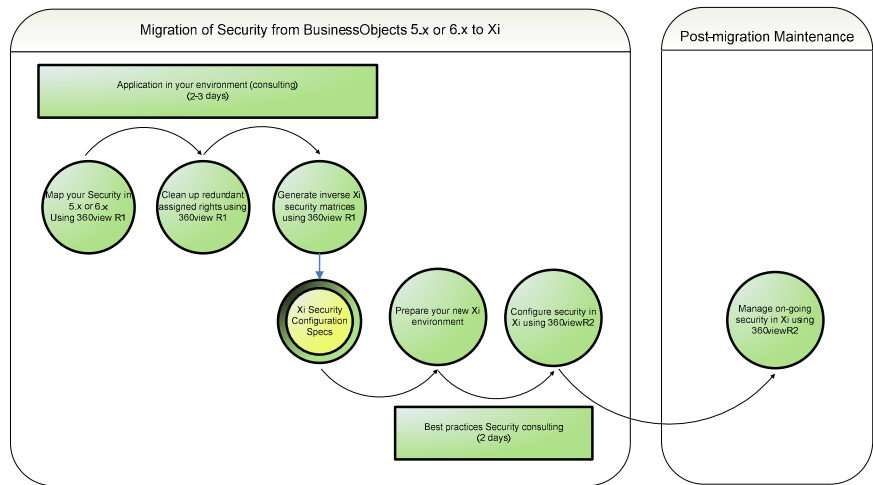

360view is meant for **corporate security auditors, BusinessObjects administrators** and help desk security operators.

What can 360view do to help me with my migration to Xi?

Please contact us for a full demo and more details

360view Release 1 works with BusinessObjects 5.x/6.x to provide you with a 100% accurate map of your security, giving you the capacity to clean up your effective rights definition before you migrate. Release 1 also converts your security definition from a user-centric model to Xi's object-centric model, giving you clear configuration specs which will avoid any side effects due to errors. Releases 1 & 2 are bundled to give you our **Security Migration Pack**.

Security Management Process in BusinessObjects

agileDSS Corporation

agileDSS' mission is to assist customers in optimizing the management and operation of their Business Intelligence infrastructure by securing their investment and reducing their maintenance and operational costs.

agileDSS fulfills its mission by developing and distributing world class software.
